

Service map for client zone pages

Context

LIZY provides the following services to their customers: Maintenance, Tire replacement, Glass repair, Body repair. Those services are provided through a network of partners which can provide one or more of those services.

User story

As a customer, **when** I need to find needed car service **I want** to see the list of possible places on the website together with a map **so that** I can find the most convenient location for me

Use cases

You'll find hereunder some use cases taking place on mobile as on desktop.

1. The customer is planning an upcoming tire replacement and looks for the most convenient place.
2. The customer was involved in an accident or a breakdown and he needs to find the closest service.
3. Customer is making a leasing decision and wants to see all possible services.

Proposed solution

Map allowing the customer to easily filter on the needed services. The proposed UI should be thought of for **mobile** screens **first**.

Base features:

1. Focus on the places around your current location
2. Filter on one or more services
3. Contact the service provider via phone

Nice to have:

1. Contact the service provider via email
2. Switch between a map and an listview
3. Distinguish pins by service provided
4. Focus on the places around another location searched by text

Don't hesitate to come with a better solution.

Expectations

- **Framework:** React.js or React Native
- **Places:** use zomato API and use three restaurant types [Italian, Lebanese, Japanese] as services.
- **Hosting:** up to you, we just need a public URL
- **Tests:** either unit / UI, we don't need 100% coverage
- **BONUS: Localisation:** managed two languages

Deliverables

- Access to repo
- respect deadline
